GuacamoleID Standalone vs. Connected

A BRIEF OVERVIEW

For GuacamoleID, we have two types of desktop applications

Standalone application

This application works entirely on the local device and only utilizes our server for license activation. The only network connection is when it connects to the server to verify and authorize the license required for using GuacamoleID. This version is suitable for dedicated laptops/workstations.

Connected application

This application also runs on the local device but has the capability to interact with the GuacamoleID platform on your server to offer additional functionalities such as central configuration management, central auditing, and face registration sharing.

Some key features of the Connected application

1. Device management by groups

This functionality enables us to organize devices into groups in order to simplify the management of their configuration and share biometric registrations (see the next feature).

2. Biometric data synchronization

In the case of biometric data, all devices belonging to the same group share this data among themselves. This allows individuals whose facial data is registered in the GuacamoleID platform to be recognized on any device within their group without the need to register on each device separately.

3. Client configuration management

All configuration options in the Connected Client are controlled and managed through your server. This means that you can define which options are available for each group of devices, allowing you to limit specific options or establish a single option available for a specific group. This provides flexibility and control in the application's configuration.

4. Add-on: Usage metrics generation

The Connected Application sends anonymized logs to the server, allowing you to gather data on the application's usage and present them as a dashboard. These metrics are valuable for obtaining insights into how the application is used and provide useful information for making informed decisions about improvements and updates.

Every Computer Has Chips,
It's Time For Guacamole!
